

# From Smart Machines to Smart Supply Chains: Some Missing Pieces

LEON MCGINNIS

PROFESSOR EMERITUS

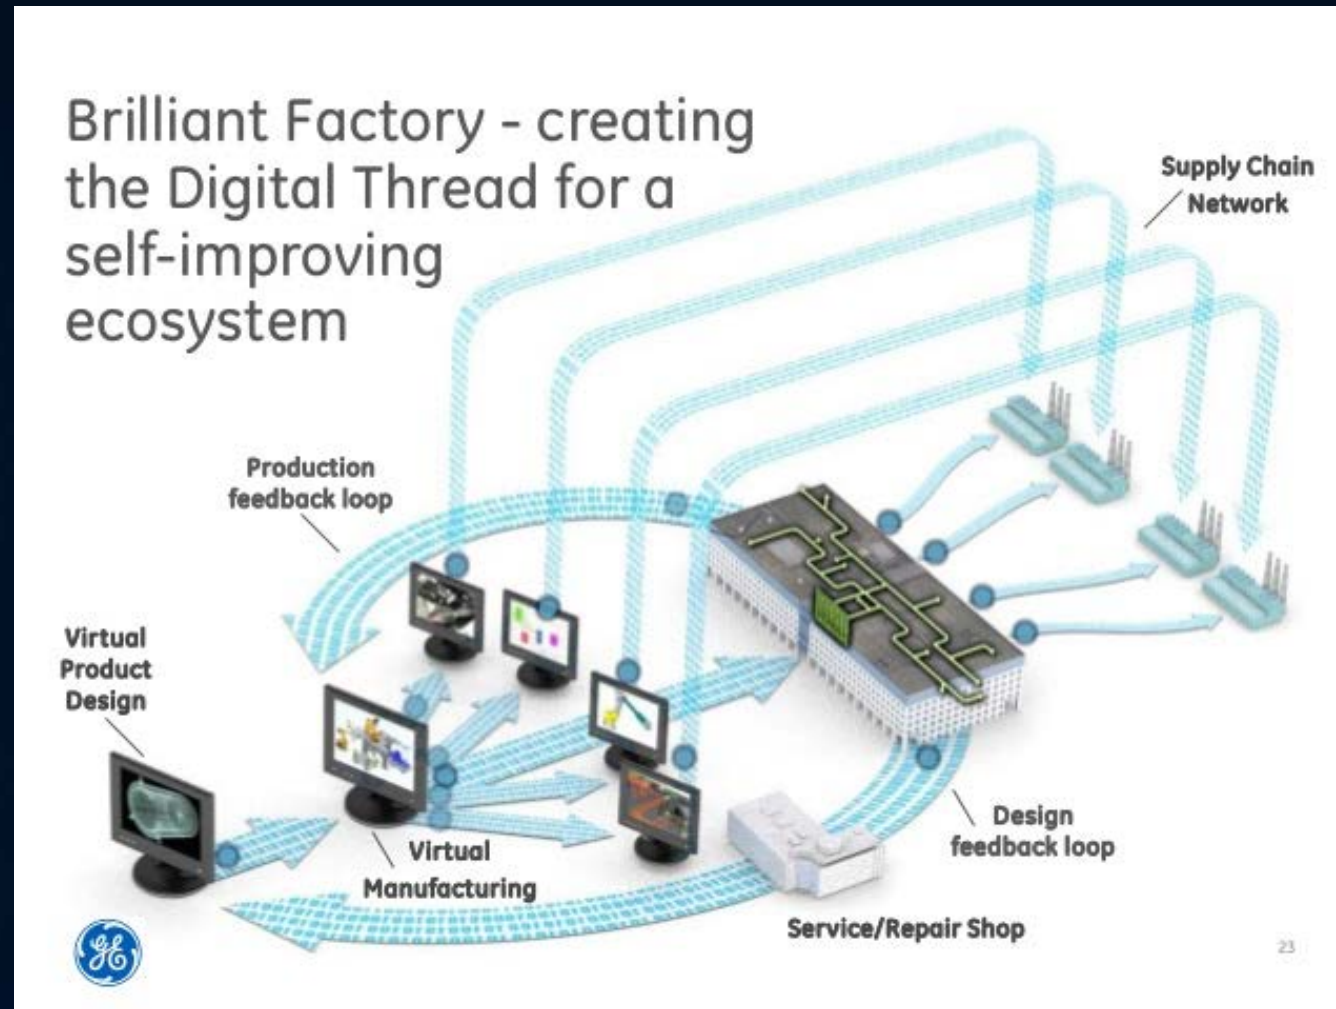

STEWART SCHOOL OF INDUSTRIAL AND SYSTEMS ENGINEERING

GEORGIA TECH

# Agenda

- Smart factory context
- Reality check
- It's all about decision making
- We all use models
- Lessons from device engineering
- The missing piece
- Getting what we need

# Smart Factory

# $10^6$ x number of transistors in 40 years!

## Moore's Law – The number of transistors on integrated circuit chips (1971-2016) Our World in Data

Moore's law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years. This advancement is important as other aspects of technological progress – such as processing speed or the price of electronic products – are strongly linked to Moore's law.

Data source: Wikipedia ([https://en.wikipedia.org/wiki/Transistor\\_count](https://en.wikipedia.org/wiki/Transistor_count))  
The data visualization is available at OurWorldinData.org. There you find more visualizations and research on this topic.

# After 50 years, computer wins Jeopardy!

<https://www.npr.org/2011/02/14/133697585/on-jeopardy-its-man-vs-this-machine>

Today, it is very easy to take for granted that technology will solve the problem, and smart factories and supply chains really are just around the corner.

# What is a “smart machine”?

- Combines Cognitive Computing
  - Intelligent Personal Assistant (Siri)
  - Specialized Applications (meeting scheduler)
  - Intelligent Agent (call center agent)
  - Platform (Watson)
- With hardware (e.g., robot, automobile)
- And “machine-to-machine” technology

# Self-Driving Truck "Platoon"

# Schneider Electric Says:

Existing smart technologies include:

- Ethernet-based networking
- Enhanced SCADA systems
- Web-enabled PLCs
- Advanced motion controllers
- Intelligent AC drives

# Top 5 Automotive Robotic Applications\*

- Vision: aligning parts for assembly
- Collaborating robots : handling and welding
- Robotic hand: exoskeleton devices
- Collaborating with humans: final assembly of doors
- Painting

\*<https://blog.robotiq.com/bid/69722/Top-5-Robotic-Applications-in-the-Automotive-Industry>

# Contemporary “Smart Machines”

- Highly structured environments
- Narrowly defined tasks
- Ability to report diagnostics
- Task-related decision making
- Limited ability to interact

***How do we create smart factories and smart supply chains from smart machines?***

# What is a "smart factory"?

# Which was the “smarter” team?

Rk '17	Team	2017 Payroll
1	Dodgers	\$225,553,087
2	Tigers	\$199,750,600
3	Yankees	\$195,282,058
4	Giants	\$181,514,431
5	Red Sox	\$178,818,052

18	Indians	\$125,808,029
19	Astros	\$122,407,233
20	Marlins	\$120,191,297

# Decision-Making Drives Results

***HOW DO WE GET TO (EVEN) BETTER DECISION MAKING?***

# *In The Fab, Smarter Is:*

- Better operations management decisions

- Shorter cycle times
- More throughput
- Less WIP
- Lower costs
- Higher quality

*Without sacrificing profitability!*

- Better systems design decisions

- Lower system costs
- Faster ramp
- Greater flexibility
- Greater adaptability

*Without sacrificing capability!*

# *In The Supply Chain, Smarter Is:*

- Better operations management decisions

- More on time delivery
- Better asset utilization
- Less inventory
- Lower costs
- Higher quality

*Without sacrificing profitability!*

- Better systems design decisions

- Lower system costs
- Faster ramp
- Greater flexibility
- Greater adaptability

*Without sacrificing capability!*

**“Smarter” is not defined by input (investment),  
it’s defined by output (results).**

**It’s achieved by using resources wisely—both  
investment resources and operational resources.**

**It requires good decision-making!**

# All decisions are based on models

What kinds of models are decision makers using?

<https://asia.nikkei.com/Business/AC/TSMC-ARM-team-up-to-fight-Intel-in-data-center-chips>

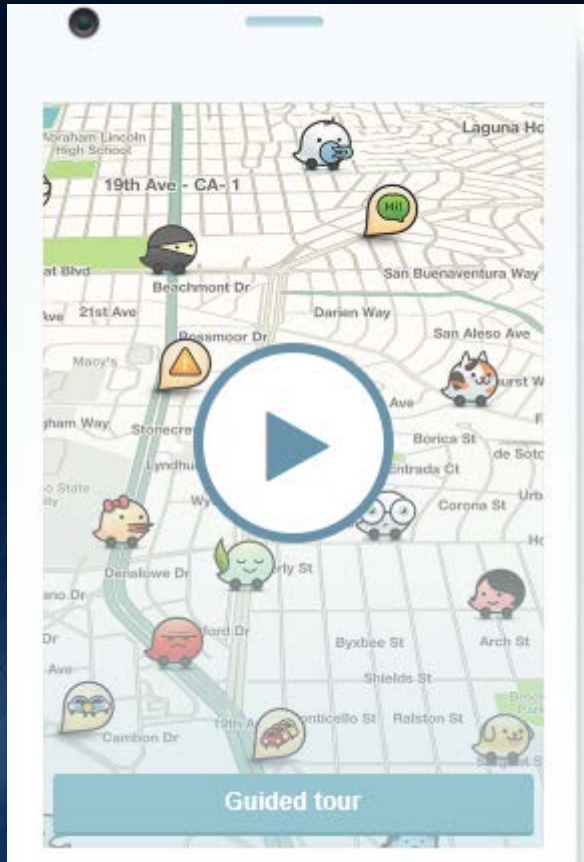

# Missing Puzzle Pieces – The System Model

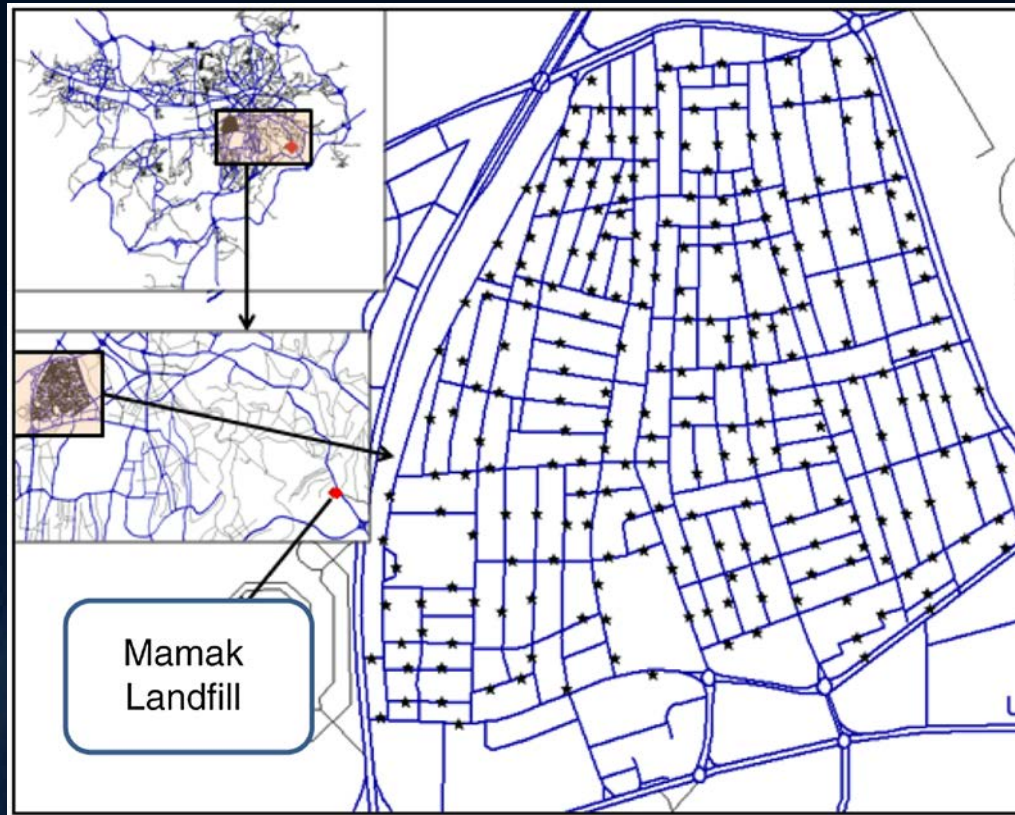

# Example: Operational Decision Support

**Waze: combination of map data (“static” data about the system) and real-time speed data (collected from Waze users) to compute the “optimal” route for you.**

# Underlying Formal Model

[https://ascelibrary.org/doi/abs/10.1061/\(ASCE\)CP.1943-5487.0000502](https://ascelibrary.org/doi/abs/10.1061/(ASCE)CP.1943-5487.0000502)

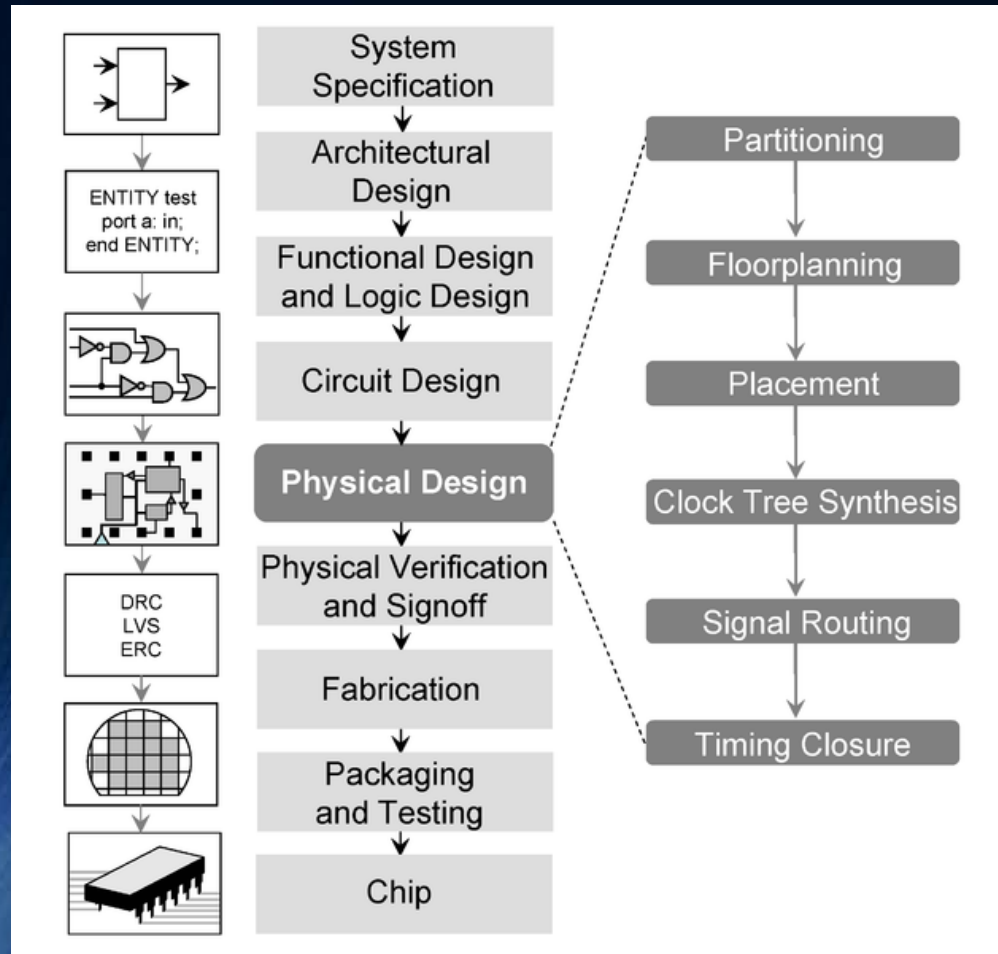

Directed network (“graph”) with edge distance representing travel times; use shortest path algorithm to determine best route between two points on the network

**No route-finding app can be successful without this underlying formal representation of the transportation system!**

# 10<sup>6</sup> x number of transistors in 40 years!

# Designing IC's with $10^7$ transistors

<https://commons.wikimedia.org/wiki/File:PhysicalDesign.png>

**Is only possible because of computational tool chains that enable both specification and analysis at every level from system architecture and function all the way down to the physical layout of the device.**

**This tool chain is only possible because of formal—computable—system models at each of these levels of abstraction and VHDL was the key.**

### Semiconductor Line Layouts

Explicit Knowledge = Media-based

Paper-based, multimedia, digitally indexed, digitally active, etc.

20%

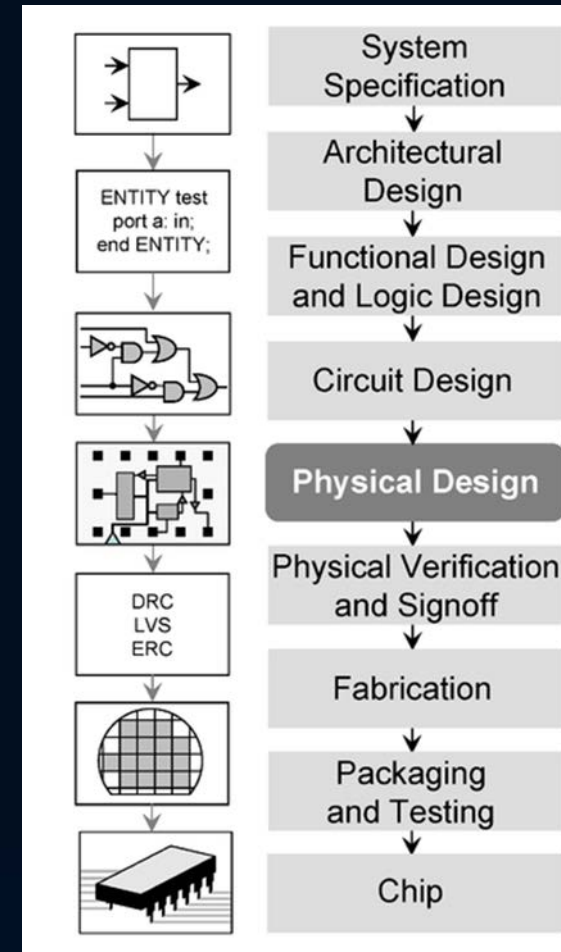

80%

Tacit Knowledge = In people's head

# Fab Formal Model Requirements

- Elements of the fab
  - Tools, material handling, founs, people, consumables, ...
- Connections
  - Supporting product flow; control flow; information flow; ...
- Behavior of resources
  - Resource states and transitions; processes; ...
- Products
  - Process plans; production rates; lot sizes; variations; ...
- Performance prediction
- ***At multiple levels of abstraction***

# Predictions Answer Questions

- Capability
  - Can this fab produce this product?
- Capacity
  - Can this fab produce this product?
- Cycle time
  - Under this load, what will be the amount and distribution of WIP?
- Work in process
  - Under this load, what will be the amount and distribution of WIP?
- And many more questions supporting fab design decisions

Resource portfolio  
Resource configuration (layout)  
Control policies and algorithms  
Production plan

We already know how  
to construct models to  
support answering  
these questions!

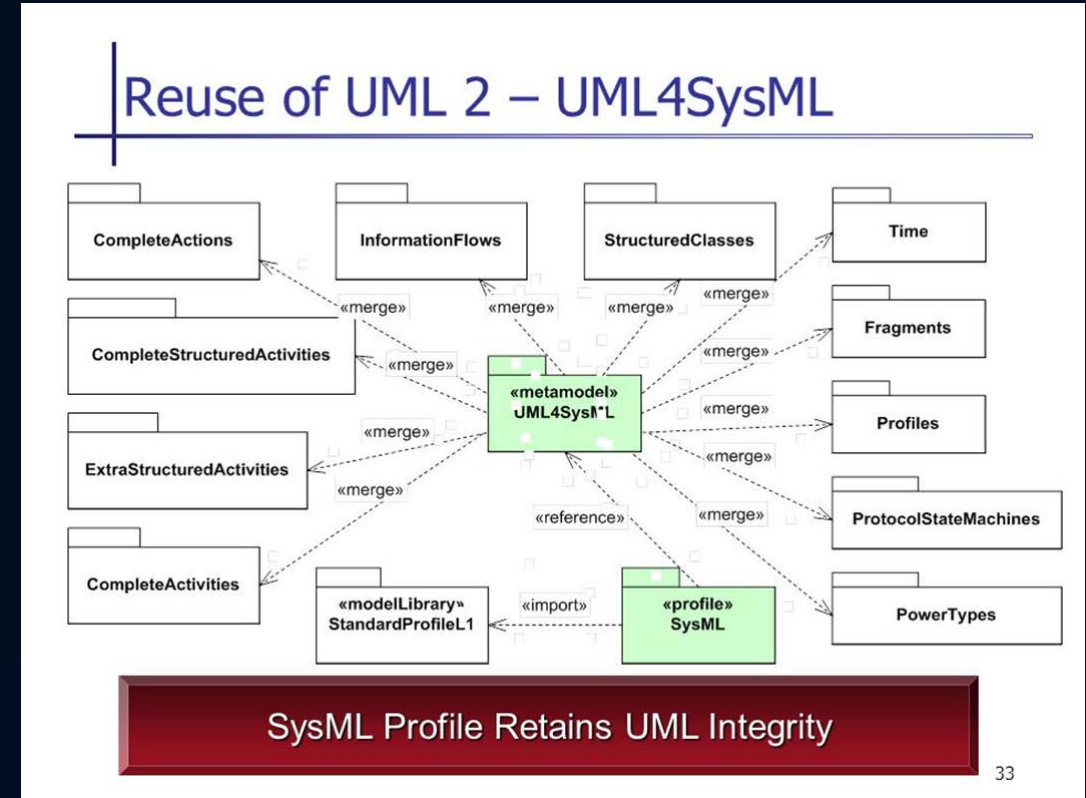

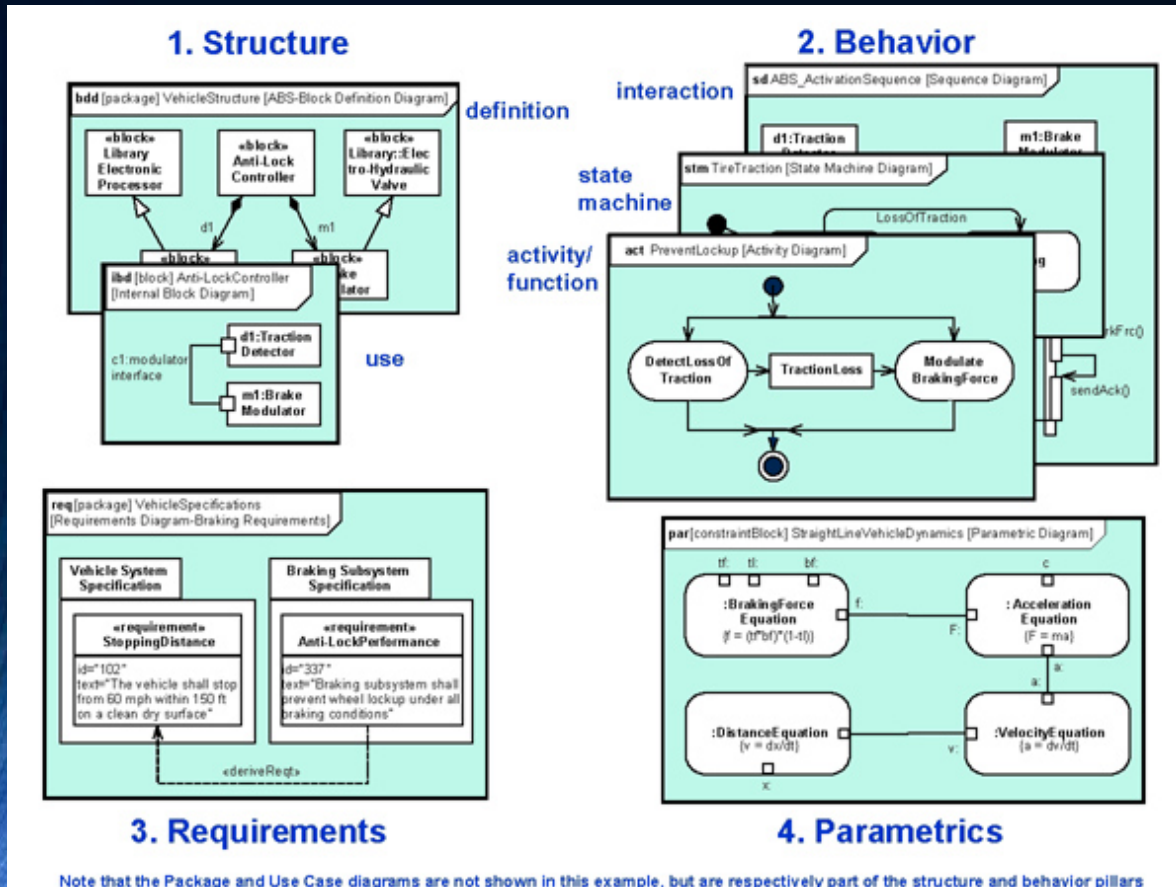

Can we do for fabs what has  
been accomplished for devices?

*I THINK THE ANSWER IS YES! THE KEY IS SYSTEM MODELS...*

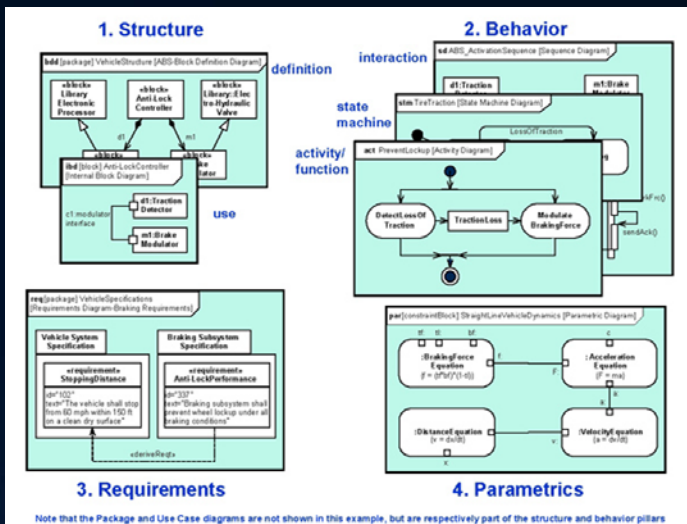

# OMG SysML™

## Graphic Presentation

## Underlying formal semantics and syntax

**Domain-Specific  
 "Fab Description  
 Language" or FDL**

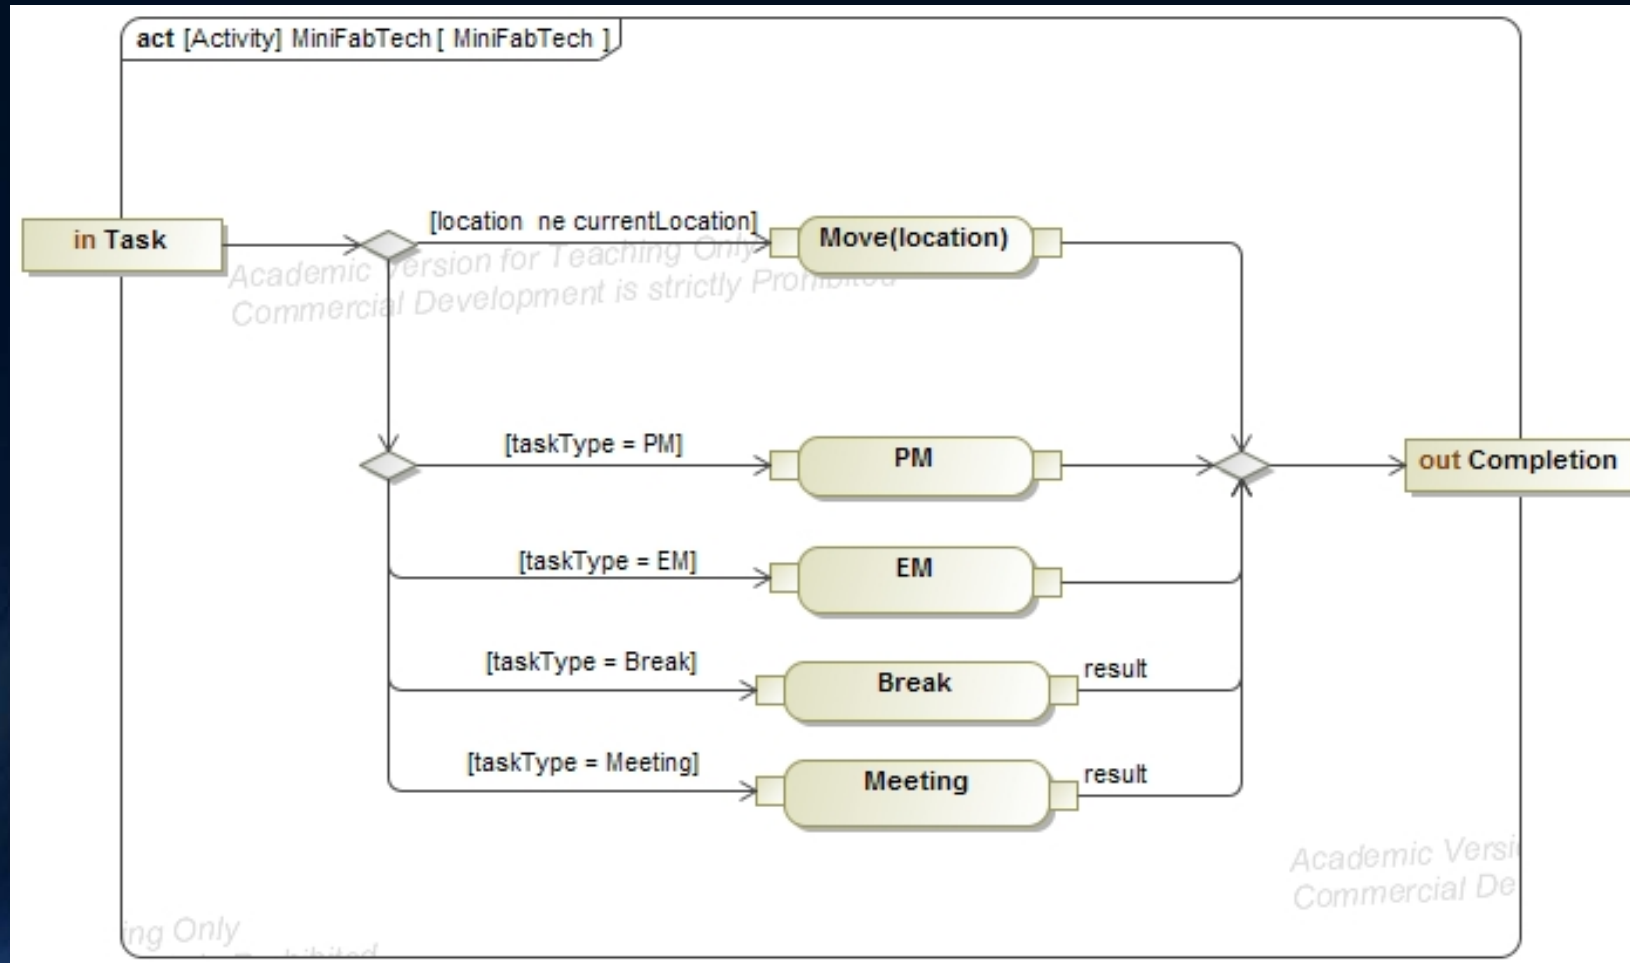

# Fab Structure

# Fab Behavior: State Machines

# Task Behavior: Activity

# System Modeling Benefits

- System specified at multiple levels of abstraction/fidelity
  - Essential to support design
- Graphical models are easy to understand
  - Essential for capturing knowledge and achieving “buy-in”
- Basis for agreement among subject matter experts
  - Essential for large-scale complex multi-disciplinary systems
- Foundation for analysis model development
  - Essential for enabling the emergence of tool chains
- Foundation for analysis model automation
  - Essential for deployment to practice

# Analysis model automation

1a) System Description

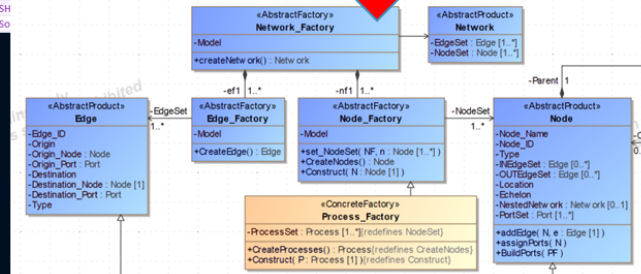

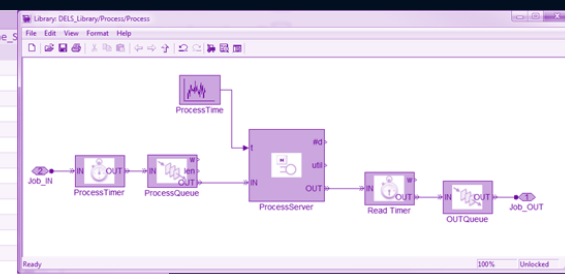

```

«ConcreteProduct»
class Process
-Workstation_ID: Workstation
-ServerCount
-StorageCapacity
-ProcessTime_Mean
-ProcessTime_Stdev
-/Utilization
-/Throughput
-/AverageSystemTime
-/AverageWaitingTime
-/AverageQueueLength
+setProcessTime( P )
+setServerCount()
+setTimer()
+setStorageCapacity()
+buildUtilization()
+buildThroughput()
+buildAverageSystemTime()
+buildAverageWaitingTime()
+buildAverageQueueLength()
    
```

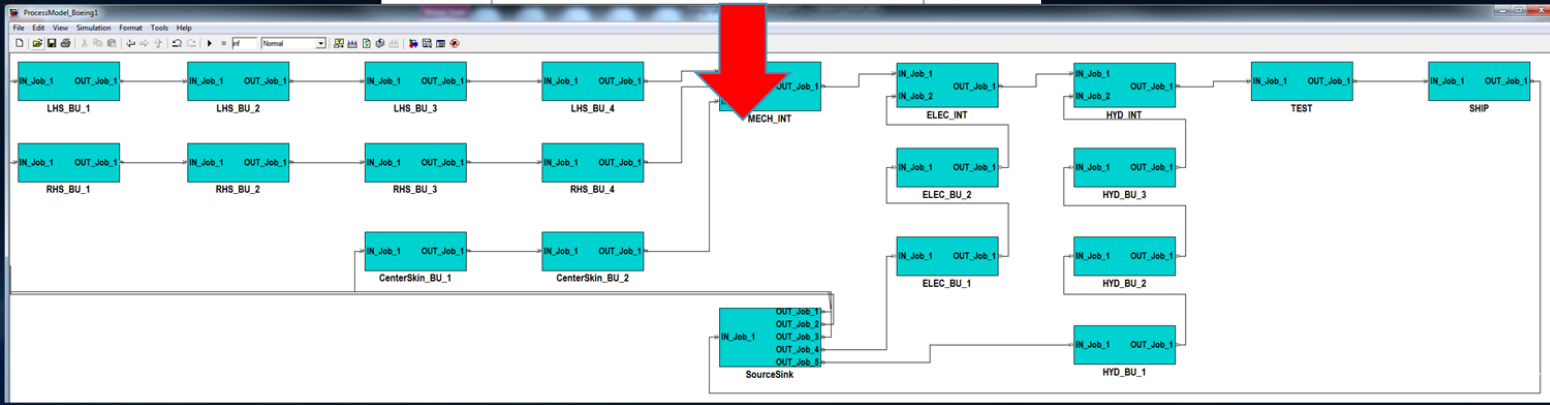

1b) Instance Data

Node_ID	Node_Name	Type	Parent_ID	Echelon	ServerCount	ProcessTime_Mean	ProcessTime_Stdev
1	LHS_BU_1	Process	0	1	1	4	
2	LHS_BU_2	Process	0	2	1	1	
3	LHS_BU_3	Process	0	3	1	2	
4	LHS_BU_4	Process	0	4	1	2	
5	RHS_BU_1	Process	0	1	1	4	
6	RHS_BU_2	Process	0	2	1	1	
7	RHS_BU_3	Process	0	3	1	2	
8	RHS_BU_4	Process	0	4	1	2	
9	CenterSkin_BU_1	Process	0	3	1	4	
10	CenterSkin_BU_2	Process	0	4	1	5	
11	MECH_INT	AssyProcess	0	5	1	6	
12	ELEC_INT	AssyProcess	0	6	1	6	
13	HYD_INT	AssyProcess	0	7	1	6	
14	ELEC_BU_2	Process	0	6	1	4.5	
15	ELEC_BU_1	Process	0	6	1	4.5	
16	HYD_BU_3	Process	0	7	1	2	
17	HYD_BU_2	Process	0	7	1	3	
18	HYD_BU_1	Process	0	7	1	4	
19	TEST	Process	0	5	1	1	
20	SHIP	Process	0	5	1	1	
21	SINK	Process	0	5	1	1	

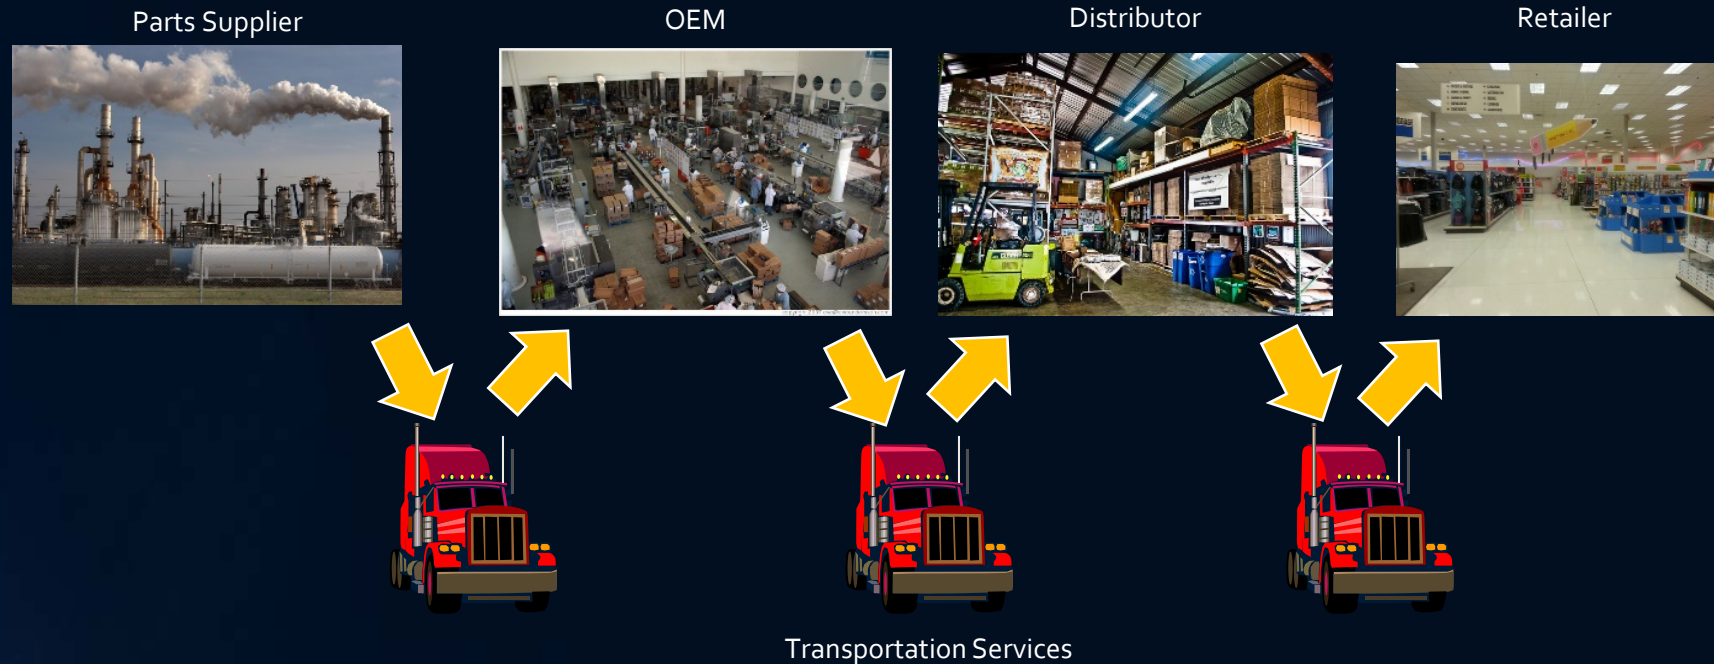

1c) Simulation Components

2) Transformation Engine

# Supply Chain System Modeling

Units of flow move through a network of resources, which execute processes that transform the units of flow in some way—location, age, configuration, information, etc. These are **"discrete event logistics systems" or DELS**.

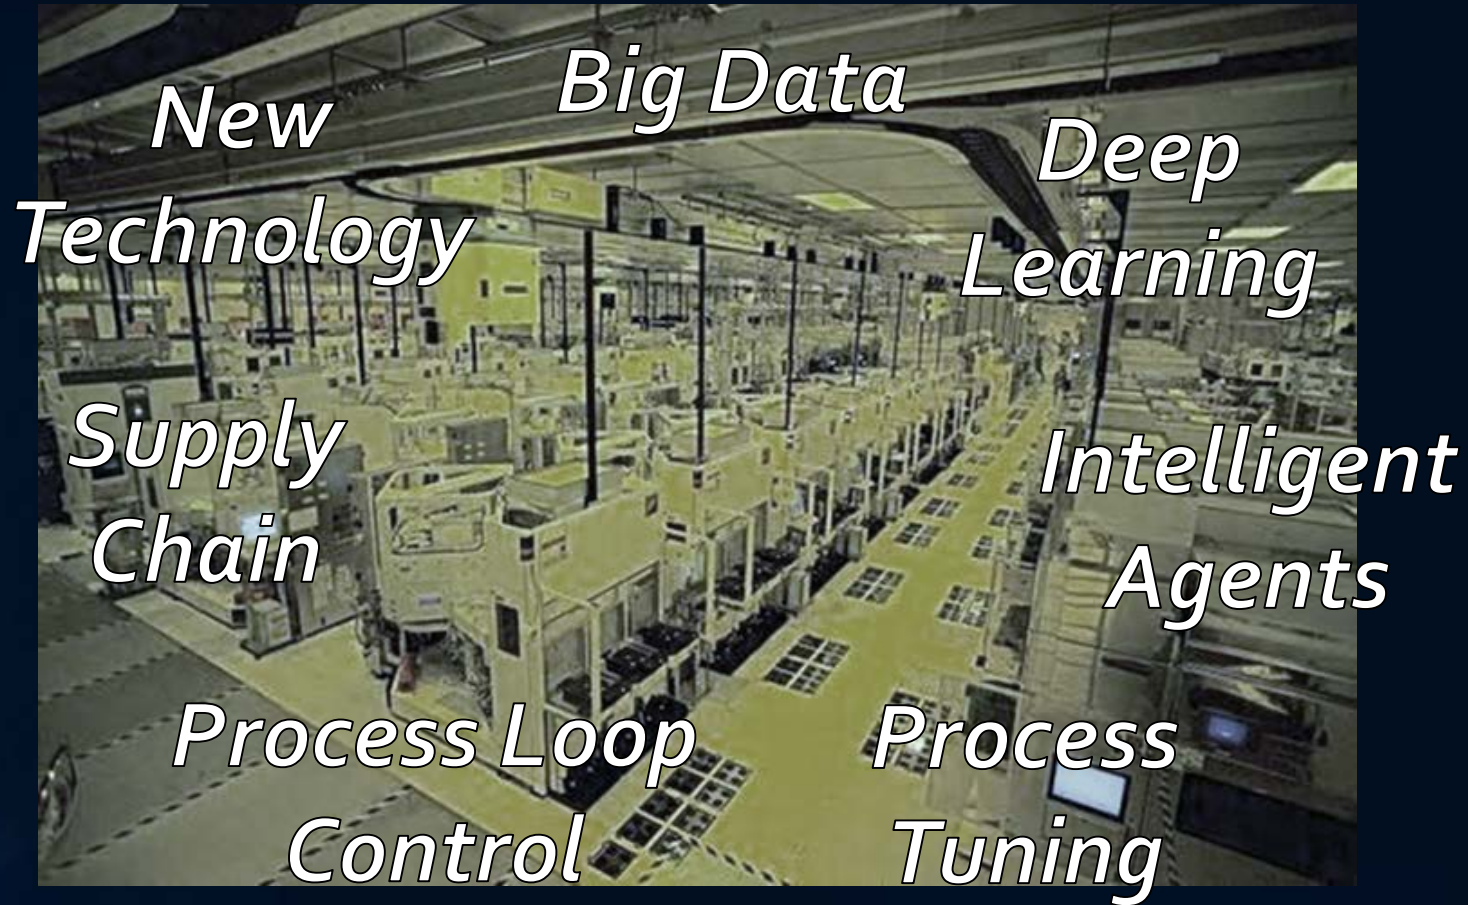

Transformations can be adequately described by their start and end events, and by the summary description of the state change accomplished.

# Some typical questions

- Do we have sufficient capacity to add a new program in our final assembly and test facility?
- Should we use a third-party logistics network, and if so, what are the risks of using a third-party logistics network, from each point?
- How much investment is required to build a new assembly and test facility to ensure a 99% on-time customer service?
- For a new product, which parts should we outsource and which should we produce in-house?

We already know how to construct models to support answering these questions!

# New Questions/Answers?

Formal system models will give us the means to better organize, synthesize, communicate and share the new knowledge that is being created ***about the system.***

# SysML is the key

- Based on a formal meta-model
- Formal semantics and syntax
- Extensible through generalization and redefinition
- API provides computational access to the model => build apps

# How will we get there?

- Research and development
- Demonstration projects
  - NIST: Smart Manufacturing Operations Management
  - Industry: Production System Reference Model
- Industry-university collaboration
  - INCOSE Challenge Team: Production and Logistics System Modeling  
<http://www.omgwiki.org/MBSE/doku.php?id=mbse:prodlog>

# Why should we do it?

- Factories and supply chains are under stress
  - Speed
  - Cost
  - Adaptability
- They are complex systems with many interacting parts
- We need virtual systems (“digital twins”):
  - To develop/demonstrate innovations in design and control
  - To train “intelligent agents”

# Why is this so much harder than VHDL?

- Because the US Department of Defense funded the development of a device specification language and standard to document the devices being purchased for weapons systems—money was no object
- There is not (at this time) any government agency or program requiring the documentation of factories or supply chains, and so a “DELSDL” must be created by the owners of factories and supply chains, in a large scale collaborative effort.
- But the required technologies are at hand. All that is needed in addition is the will and the commitment of resources.

# Clarke's First Law

<https://www.penguinrandomhouse.com/authors/5058/arthur-c-clarke>

**When a distinguished but elderly scientist plenary speaker states that something is possible, they are almost certainly right. When they state that something is impossible, they are very probably wrong.**

# Clarke's First Law (modified)

<https://www.penguinrandomhouse.com/authors/5058/arthur-c-clarke>

When a ~~distinguished but elderly scientist~~ plenary speaker from far away states that something is possible, they are almost certainly right. When they state that something is impossible, they are very probably wrong.

Your turn
